Selectively used for tre glycinamide

y killing methylthioadenosine phosphorylase deficient cells reating cell proliferative disorders comprises administering e ribonucleotide formyltransferase and anti-toxicity agent.

38

182-183;

189pp;

English.

This invention relates to novel combination therapies that selectively kill methylthioadenosine phosphorylase (MTAP) deficient cells. The combination therapies comprise administering an inhibitor of glycinamic

glycinamide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ribonucleotide formyltransferase (GARFT) and/or aminoimidazolecarboximide ribonucleotide formyltransferase (AICARFT), and administering an antitoxicity agent during and after administration of the inhibitor. The combination therapies can be used for selectively killing MTAP deficient cells, and for treating cell proliferative disorders e.g. lung cancer, leukaemia, glioma, urothelial cancer, colon cancer, breast cancer, prostate cancer, pancreatic cancer skin cancer and head and neck cancer. The anti-toxicity agent counteracts the toxicity of the inhibitor in the MTAP-competent (i.e. healthy) cells and increases the maximally tolerated dose of the inhibitor. This polynucleotide sequence represents the cloned MTAP cDNA of the invention.

                                                                                                                                                                                                               The invention relates to 971 novel human cDNA sequences (ADC29919-CC ADC3088) and the polypoptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the crecombinant production of a polypoptide of the invention; an antibody against a polypoptide of the invention; and methods of cidentifying a compound which binds to a polypoptide of the invention. The cidentifying a medical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention; methods for the identification of compounds that modulate the contist sequences corresponding to the cDNA sequences of the invention are identification of mucleic acids and polypoptide of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the customic for treating diseases such as Parkinson's diseases or also useful in disagnostics, drug screening, forensics, gene mapping, in the cancer, The nucleic acids may also be used as hybridisation polypoptides of the invention are also useful in penerating antibodies, as molecular weight markers, and in the recombinant production of a protein. They are cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypoptides are also useful in generating antibodies, as molecular weight markers, cand as food supplements. The present sequence represents a specifically to the printed specification, but was contained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                               The sequence encodes a methylthioadenosine-phosphorylase, and is located at chromosome-9p21. A cyclin-dependent protein-kinase-4-inhibitor (CDK4I) tumour suppressor gene (AAT15157-58) is located between this gene and an interferon-alpha gene cluster, and has been isolated by chromosome walking. The CDK4I gene, probe and primer derivatives and the gene product may be used in diagnosis of cancer, particularly melanoma (especially dysplastic nevus syndrome), glioma, non-small cell lung carcinoma or leukaemia. The gene may also be used in cancer gene therapy, or in antitumour antisense oligonucleotide or ribozyme construction. Antibodies against CDK4I may be used in diagnosis or in vivo imaging

Absence of MTAse from a cell is indicative of malignancy. (Updated on 25-MAR-2003 to correct PN field.)

adenylsuccinate

-Bn

```
purospnorylase (MTase), obtained from a cosmid gene library constructed from human placenta DNA by screening with a MTase cDNA probe. A claimed CC method for inhibiting the activity adenylsuccinate synthetase (ASS) in CC mammalian cells deficient in MTAse activity involves: (a) determining that a population of cells obtained from a mammalian host is MTase CC deficient; and (b) administering an ASS inhibitor (preferably L-CC alanosine) to the host so that the MTase deficient host cells are depleted of AMP. The method is especially used to treat human MTAse-CC deficient primary tumour cells, specifically non-small cell lung cancer, acute lymphoblastic leukaemia (ALL), glioma and urothelial tumour cells. MTAse catabolises methylthioadenosine to adenine for endogenous salvage in corporation into the intracellular AMP pool. The claimed method considerives the cells of substrate for de novo synthesis of AMP, resulting in selective killing of these cells. MTAse sequence-specific coligonuclotides can be used to detect the presence or ahaannous cells in malignant cell lines
                                                                                                                Query Match

d inactive methylthicadenosine phosphorylase (MTAse) in cells, using oligonuclectide probes which hybridize to MTAse id coding regions. Detection of MTAse encoding nucleic acid the cell has catalytically active MTAse. The method is useful ing malignant cells with a deficient MTAse gene, useful for g malignant cells which are suitable targets for methionine cration therapy. The new method is simple, efficient and lat determining MTAse negative cells, unlike prior art

                                                                                                                                                                                                                                                                                                                                    WPI;
                                                                                                                                                                                                                                 Inhibiting adenine succinate synthetase (ASS) methylthicadenosine phosphorylase deficient cinvolves administering ASS inhibitor which demonophosphate in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        techniques, which include analysis of catalytic activity in cell cultures, requiring a commercially unavailable radiochemical substrate, and immunoassays, using MTAse antibodies which are unable to be produced in sufficient quantities. Recombinant MTAse protein produced using the new polynucleotide and vector, allows greater and purer production of MTAse than prior art techniques (using the Rangione method) for isolating native MTAse. This sequence represents human MTAse encoding DNA which is used in the method of the invention
                                                                                            The present invention relates to inhibiting adenyl (ASS) activity in methylthicadenosine phosphorylase cells of mammalian host. The invention may be used cancer, especially breest and colon cancer
                                                                                                                                                                                                                                                                                                                                                                        Carrera

                The present invention relates to novel tumour suppressor genes, termed as cyclin-dependent kinase 4 inhibitor (CDK4I) genes and their corresponding proteins. The polynucleotides are useful for preparing a composition for diagnosing or treating cancer. Sequences of the invention are also useful in gene therapy. The present sequence is human methylthicadenosine phosphorylase (MTAse) genomic DNA used in the exemplification of the invention
                                                                                                                                                                                                                                                                                         exon

                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                   Antigenic peptides may be generated from this sequence encoding methyladenosine-phosphorylase, which are then used to generate specific for MTAse. The produced antibodies may be used in an if or the detection of MTase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;

This is the DNA sequence of a human methylthioadenosine phosphorylase C (MTAse) genomic DNA clone that was isolated from a cosmid gene library using an MTAse cDNA probe. The encoded enzyme catabolises methylthioadenosine to adenine for endogenous salvage incorporation into the intracellular AMP pool. The invention relates to methods for treating and preventing the onset and maintenance of multiple drug resistance (MDR) in animals undergoing cancer chemotherapy. In the methods provided, cells are depleted of AMP and ATP and are thus unable to supprt P-CC glycoprotein activity. One method obtains a population of target cells are treated with a purine synthesis inhibitor, such as L-alanosine, which starves the cells of adenine and suppresses P-glycoprotein activity. The Small-cell lung cancer cells, acute lymphoblastic leukemia cells, glioma cells or urothelial tumor cells, preferably in humans. MTAse competent cells are also treated for MDR with purine synthesis inhibitors. MTAse competent cells are also treated for malignancy with other anti-cancer drugs. MTase sequence-specific oligonucleotides can be used to detect the presence or absence of MTAse in malignant cell lines
                                                                                                                                                                                                                                                                                                                                     Query Match

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decrease expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to
                                                                                                                                                                                                                                                              Nucleic

The inventive method is simple and efficient in detecting the presence of MTAse in the mammalian cell. The availability of the recombinant MTAse enables the production of highly pure material with greater ease and in greater quantities than was obtained using Rangione method for the isolation and purification of native MTAse. This sequence encodes rat methylthioadenosine phosphorylase (MTAse)
                                                                                                                                                                                                                                                                                                                           WPI; 2001-235357/24

Thiaglingam
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  into a host can be used
ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78993 to ABB79004 represent proteins encoded by the ABQ60776 to ABQ60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and for detecting the presence or absence of a polynucleotide encoded by a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I), and for determining the phenotype of cells in a sample of cells from a patient. (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate
                                                                                                                                                                                                                                                                                                                                                                                                       New isol

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ent the patients own production of P. Additionally, N may be used uce the colon cancer-associated Ps, by inserting the nucleic acids host cell and culturing the cell to express the proteins. N and P used in the prevention, diagnosis and treatment of colorectal mas and cancers. AAH37196 to AAH37204 and AAB77789 represent es used in the exemplification of the present invention. N.B. 66 to 682 and page 7053 of the sequence listing were missing at publication, meaning no sequences are present for SEQ ID NO:1027, 7921 and 7922

 ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78993 to ABB79004 represent proteins encoded by the ABQ60776 to ABQ60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and for detecting the presence or absence of a polynucleotide encoded by a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I), and for determining the phenotype of cells in a sample of cells from a patient. (I) is useful for determining the presence of state of other type of cancer, in antisense therapy, to generate macroarrays on a solid surface, to identify a chromosome on which the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     macroarrays on a solid surface, to identify a chromomography corresponding gene resides, and in tissue profiling, analysis, mapping and diagnostic applications.                                                                            Ş
                                                                                                                                                                               The present invention describes a method (M1) for screening for an anticomeoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's tumour
                                                                                                       Query Match
